

I want to answer 5 questions before any coding:

Question 1

When customer trigger = 10,000

and FG stock available = 4,000

Do they:

A. Dispatch 4,000 immediately and create RS = 6,000 + trend

or

B. Create RS = full 10,000 + trend

This affects the core RS formula.

Question 2

Suppose:

RS = 10,000

Production = 10,000

QA Accepted = 9,500

Dispatch = 7,000

What should next shortage be?

A. 0 (production completed)

B. 500 (QA rejection)

C. 2,500 (not dispatched)

This determines whether shortage should be production-based, QA-based, or dispatch-based.

Question 3

Current ERP allows multiple cycles.

you said:

Multiple cycles = No

I suspect they mean:

"Only one active cycle at a time."

Please confirm

Can they create a new RS tomorrow while today's RS is still unfinished?

Yes / No

Question 4

Trend Quantity

You clearly said:

$RS = \text{balance qty} + \text{trend qty}.$

How is trend calculated?

- Manual entry?
- Last 7 days?
- Last 30 days?
- Customer monthly schedule?

This is important.

Question 5

Who should own RS?

You answered:

Store Department.

Current role setup already points in that direction.

We should confirm:

Can Production modify RS after Store locks it?

My recommendation: **No.**

Store owns demand planning.

Production owns execution.
